

Data Cleaning & Reporting Automation

Developed By: R. Himavanthi

Abstract

This project demonstrates cleaning raw employee data, handling missing values and duplicates, transforming data, and building interactive Power BI reports for business insights.

Introduction

The solution automates data preparation and reporting to improve data quality and reduce manual effort.

Objectives

- Import CSV data.
- Clean and preprocess records.
- Remove duplicates.
- Handle missing values.
- Create KPIs and dashboards in Power BI.

Dataset

Employee dataset with Employee ID, Name, Department, City, Joining Date, Salary, Attendance, Performance Rating, Email and Phone.

Methodology

Data Collection → Data Cleaning → Data Transformation → DAX Measures → Dashboard Development → Reporting.

Dashboard KPIs

Total Records, Total Employees, Duplicate Records, Missing Values, Average Salary, Average Attendance, Average Rating, Total Departments, and Total Cities.

Business Benefits

Improves reporting accuracy, reduces manual work, standardizes employee data, and enables better business decisions.

Conclusion

The project showcases practical data cleaning, transformation, visualization, and reporting skills using Power BI.
